'No thanks' to electric power for our classics, say 76 per cent of

owners asked...

Synthetic fuel development is crucial for classic and collector car industry, as 76 per cent of owners favour e-fuels (synthetic fuels) over electric conversion in net-zero future...

- Specialist insurer Footman James polled classic car owners during recent Coffee & Chrome event to gain insight into what future, non-fossil fueled options classic car owners may use.
- When asked: 'How do you think you would power your classic / collectable car if petrol or diesel wasn't available?', 76 per cent of respondents said with synthetic fuels.
- Results show synthetic fuels' importance for the £18.3 billion turnover classic car industry.
- Meanwhile 24 per cent of voters opted for electric conversions being the favoured method of how classic car enthusiasts will power their vehicles in the future.
- As studied in its *Indicator Report* earlier this year, 47 per cent of Footman James' audience already feel the pressure of environmental scrutiny against classic cars.
- Research conducted by Footman James, one of the leading classic car insurance providers that offers policies for classic and specialist vehicles.

Synthetic fuels are the favoured zero-emission alternative for over three quarters of classic and collector car owners, Footman James has found. Asking its audience 'How do you think you would power your classic / collectable car if petrol or diesel wasn't available?'. 76 per cent voted for synthetic fuels, and the other 24 per cent thought they would convert their classic / collectable car to run on electric power. The results show the importance of affordable sustainable fuels being easily available to power classic and collector cars in the future.

Polled during its Coffee & Chrome event in October 2022 (with 728 confirmed individual answers given) - where classic, collectable and rare vehicles are displayed at the Footman James-organised gathering - the audience responded to the question concerning how classic car owners will power their cars in the future. With the majority voting that they would power their cars with synthetic fuels, the rest of the respondents thought that they would convert their petrol- or diesel-powered cars to run on electricity, thereby swapping the engine for a fully electric system in its place.

While Footman James recognises the classic and collector car industry makes up a small part of the 34.4 million Internal Combustion Engine (ICE) cars (including hybrids) on the road today, it is specifically looking at how UK drivers may power their ICE cars at a point some decades away when petrol or diesel is no longer available.

Discussing the results with the Historic and Classic Vehicles Alliance (HCVA), a 'not for profit' organisation whose mission is to protect and promote the sector and secure its long-term future, they agree that e-fuels can be a sustainable method - both manufacturing and infrastructure to deliver the fuel - to power classic cars in the future. The organisation campaigns on behalf of individuals and companies in the classic vehicle world, including specialist restorers, dealers and parts suppliers. Among the HCVA's early achievements is its campaign to raise awareness of challenges around the introduction of E10 fuel, and additionally it has a strong belief in sustainable fuels. As an organisation it also projects that the sector estimated to have an annual turnover of £18.3 billion.

"This is a fascinating question, and one that we are often asked," comments Chief Executive of the HCVA, Garry Wilson. "The reality is that if people want to keep running their classics on petrol, there will be plenty available for several decades to come. My main message is don't panic. Most of us will not have to make this difficult decision."

Expanding on the question, Wilson believes it's very much a personal decision. "Some classics are deeply impressive converted to electric, but do it because you like how they drive, not because you think you are contributing to saving the planet, which you won't be unless you drive it enough miles to recover the CO2 spike caused by battery manufacture," he emphasises. "Sustainable fuels on the other hand are a drop-in solution that, when they become widely available, we can all use without any modifications to our engines, slashing our carbon emissions immediately to 80 per cent of net-zero. That's a huge environmental win that also protects the character of our classics."

While classic cars are said to be some of the most sustainable vehicles on the planet, car owners, as proven within Footman James' recent *Indicator Report*, which studied the classic

and collector car industry, are concerned about how they will fuel their cars in the future. Within said *Indicator Report* study, 47 per cent stated they felt the pressure of environmental scrutiny on classic cars that the climate change debate brings. Alongside this, the rising cost and availability of high-octane E5 fuel, designed to be more suitable for older and more powerful vehicles (in comparison to E10, which caters for more everyday, modern engines) puts the pressure on owners further, thus proving the automotive sector needs to look at alternatives.

Managing Director of Footman James, David Bond said: “After polling our Coffee & Chrome attendees, I’m pleased to hear that they’re thinking about the future and how they may be able to align their classic cars with a net-zero future. Understanding the power that alternative fuels have for our [classic and collector car] industry, shows not only a potential positive outlook ahead, but also highlights to organisations the power that e-fuels have to secure ICE cars’ relevance and sustainability in the future. [After all, if we can keep more cars on the road rather than manufacturing new, that will save millions of tonnes of embedded carbon.](#)”

Alternative fuels... (non fossil-based fuels)

In their press release Footman James state that... “Synthetic fuels or e-fuels are made from bio waste, itself being a product of biological organisms such as plankton and algae that absorbed energy from the sun millions of years ago, or other synthetic CO₂-neutral masses. Not only are they less harmful to create, i.e. not using oil-based raw materials to make the fuel, but when synthetic fuels are burned, they also produce fewer harmful emissions. While some large vehicle manufacturers are investing in synthetic fuels, it’s widely reported that synthetic fuels may be one alternative way to power vehicles that have already been made and, due to the petrol pump infrastructure already in place, work best for classic or performance vehicles.”

Kim adds/clarifies: “There is much confusion about alternative fuels (in other words, those that are not fossil-derived varieties) and in fact synthetic or e-fuels differ from the ‘bio’ fuels that are described above. It’s VITAL to appreciate the difference.

Liquid E-fuels (synthetic fuels) are carbon-neutral and produced using renewable energy generated from solar or wind power, plus hydrogen (produced from desalinated seawater) and carbon dioxide (from the air). These fuels can be delivered using existing infrastructure for liquid fuels and enable internal combustion engines to function without the need for fossil-based fuels. If adopted on a wide scale they could help to more rapidly reduce climate-damaging emissions”.

Footman James

For over 35 years, Footman James has continued to be one of the leading specialist insurance brokers for classic vehicle owners, restorers, collectors, motor traders and competitors.

Footman James has enjoyed a unique relationship with vintage and classic vehicle enthusiasts and clubs; working with over 150 clubs and partners offering policies with benefits that are important to the enthusiast.

Footman James also insures a combined value of £2.5bn worth of vehicles; all of whom are dealt with by one of 150 dedicated members of staff that deliver and maintain a high level of service.
